Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-35835
    - Class Q Military
    - Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)

    • Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OEM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

DS015 (v1.3) October 18, 1999   Product Specification

XC4000XLA/XV Family Features

Note: XC4000XLA devices are improved versions of XC4000XL devices. The XC4000XV devices have the same features as XLA devices, incorporate additional interconnect resources and extend gate capacity to 500,000 system gates. The XC4000XV devices require a separate 2.5V power supply for internal logic but maintain 5V I/O compatibility via a separate 3.3V I/O power supply. For additional information about the XC4000XLA/XV device architecture, refer to the XC4000E/X FPGA Series general and functional descriptions.

- System-featured Field-Programmable Gate Arrays
  - Select-RAM™ memory: on-chip ultra-fast RAM with
    - Synchronous write option
    - Dual-port RAM option
  - Flexible function generators and abundant flip-flops
  - Dedicated high-speed carry logic
  - Internal 3-state bus capability
  - Eight global low-skew clock or signal distribution networks
- Flexible Array Architecture
- Low-power Segmented Routing Architecture
- Systems-oriented Features
  - IEEE 1149.1-compatible boundary scan
  - Individually programmable output slew rate
  - Programmable input pull-up or pull-down resistors
  - Unlimited reprogrammability
- Read Back Capability
  - Program verification and internal node observability

Electrical Features

- XLA Devices Require 3.0 - 3.6 V (VCC)
- XV Devices Require 2.3- 2.7 V (VCCINT) and 3.0 - 3.6 V (VCCIO)
- 5.0 V TTL compatible I/O
- 3.3 V LVTTL, LVCMOS compliant I/O
- 5.0 V and 3.0 V PCI Compliant I/O
- 12 mA or 24 mA Current Sink Capability
- Safe under All Power-up Sequences
- XLA Consumes 40% Less Power than XL
- XV Consumes 65% Less Power than XL
- Optional Input Clamping to VCC (XLA) or VCCIO (XV)

Additional Features

- Footprint Compatible with XC4000XL FPGAs - Lower cost with improved performance and lower power
- Advanced Technology — 5 layer metal, 0.25 µm CMOS process (XV) or 0.35 µm CMOS process (XLA)
- Highest Performance — System erformance beyond 100 MHz
- High Capacity — Up to 500,000 system gates and 270,000 synchronous SRAM bits
- Low Power — 3.3 V/2.5 V technology plus segmented routing architecture
- Safe and Easy to Use — Interfaces to any combination of 3.3 V and 5.0 V TTL compatible devices

6

Table 1: XC4000XLA Series Field Programmable Gate Arrays

Device	Logic Cells	Max Logic Gates (No RAM)	Max. RAM Bits (No Logic)	Typical Gate Range (Logic and RAM)*	CLB Matrix	Total CLBs	Number of Flip-Flops	Max. User I/O	Required Configuration Bits
XC4013XLA	1,368	13,000	18,432	10,000 - 30,000	24 x 24	576	1,536	192	393,632
XC4020XLA	1,862	20,000	25,088	13,000 - 40,000	28 x 28	784	2,016	224	521,880
XC4028XLA	2,432	28,000	32,768	18,000 - 50,000	32 x 32	1,024	2,560	256	668,184
XC4036XLA	3,078	36,000	41,472	22,000 - 65,000	36 x 36	1,296	3,168	288	832,528
XC4044XLA	3,800	44,000	51,200	27,000 - 80,000	40 x 40	1,600	3,840	320	1,014,928

XC4085XLA	7,448	85,000	100,352	55,000 - 180,000	56 x 56	3,136	7,168	448	1,924,992
XC40110XV	9,728	110,000	131,072	75,000 - 235,000	64 x 64	4,096	9,216	448	2,686,136
XC40150XV	12,312	150,000	165,888	100,000 - 300,000	72 x 72	5,184	11,520	448	3,373,448
XC40200XV	16,758	200,000	225,792	130,000 - 400,000	84 x 84	7,056	15,456	448	4,551,056
XC40250XV	20,102	250,000	270,848	180,000 - 500,000	92 x 92	8,464	18,400	448	5,433,888

* Maximum values of gate range assume 20-30% of CLBs used as RAM

General Description

XC4000 Series high-performance, high-capacity Field Pro-grammable Gate Arrays (FPGAs) provide the benefits of custom CMOS VLSI, while avoiding the initial cost, long development cycle, and inherent risk of a conventional masked gate array.

The result of fifteen years of FPGA design experience and feedback from thousands of customers, these FPGAs combine architectural versatility, increased speed, abundant routing resources, and new, sophisticated software to achieve fully automated implementation of complex, high-density, high-performance designs.

Figure 1:   Cross Section of Xilinx 0.25 micron, 5 layer metal XC4000XV FPGA. Visible features are five layers of metallization, tungsten plug vias and trench isolation. The small gaps above the lowest layer are 0.25 micron polysilicon MOSFET gates. The excellent planarity of each metal layer is due to the use of "chemical-mechanical polishing" or CMP. In effect, each layer is ground flat before a new layer is added.

Technology Advantage

XC4000XLA/XV FPGAs use 5 layer metal silicon technology to improve performance while reducing device cost and power. In addition, IOB enhancements provide full PCI compliance and the JTAG functionality is expanded.

Low Power Internal Logic

XC4000XV FPGAs incorporate all the features of the XLA devices but require a separate 2.5V power supply for internal logic. I/O pads are still driven from a 3.3V power supply. The 2.5V logic supply is named VCCINT and the 3.3 V IO supply is named VCCIO.

The XV devices also incorporate additional routing resources in the form of 8 octal-length segmented routing channels vertically and horizontally per row and column.

XLA/XV and XL Family Differences

The XC4000XLA/XV families of FPGAs are logically identical to XC4000EX and XC4000XL FPGAs, however I/O, configuration logic, JTAG functionality, and performance have been enhanced. In addition, they deliver:

- **Improved Performance**
  XLA/XV devices benefit from advance processing technology and a reduction in interconnect capacitance which improves performance over XL devices by more than 30%.
- **Lower Power**
  XLA/XV devices have reduced power requirements compared to equivalent XL devices.
- **Shorter routing delays**
  The smaller die of XLA/XV devices directly reduces clock delays and the delay of high-fanout signals. The reduction in clock delay allows improved pin-to-pin I/O specifications.
- **Lower Cost**
  XLA/XV device cost is directly related to the die size and has been reduced significantly from that of equivalent XL devices.
- **Express mode configuration**
  Express mode configuration is available on the XLA and XV devices.

IOB Enhancements

- **12/24 mA Output Drive**
  The XLA/XV family of FPGAs allow individual IOBs to be configured as high drive outputs. Each output can be configured to have 24 mA drive strength as opposed to the standard default strength of 12 mA.
- **VCC Clamping Diode**
  XLA and XV FPGAs have an optional clamping diode connected from each output to VCC (VCCIO for XV). When enabled they clamp ringing transients back to the 3.3V supply rail. This clamping action is required in 3.3V PCI applications. VCC clamping is a global option affecting all I/O pins. If enabled, TTL I/O compatibility is maintained, but full 5.0 Volt I/O tolerance is sacrificed.
- **Enhanced ESD protection**
  An improved ESD structure allows XV devices to safely pass the stringent 5V PCI (4.2.1.3) ringing test. This test applies an 11V pulse to each IOB for 11 ns via a 55 ohm resistor.
- **Full 3.3V and 5.0V PCI compliance**
  The addition of 12/24 mA drive, optional 3.3V clamping and improved ESD provides full compliance with either 3.3V or 5.0V PCI specifications.

Three-State Register

XC4000XLA/XV devices incorporate an optional register controlling the three-state enable in the IOBs.The use of the three-state control register can significantly improve output enable and disable time.

FastCLK Clock Buffers

The XLA/XV devices incorporate FastCLK clock buffers. Two FastCLK buffers are available on each of the right and left edges of the die. Each FastCLK buffer can provide a fast clock signal (typically < 1.5 ns clock delay) to all the IOBs within the IOB octant containing the buffer. The Fast-CLK buffers can be instantiated by use of the BUFFCLK symbols. (In addition to FastCLK buffers, the Global Early BUFGE clock buffers #1, #2, #5, and #6 can also provide fast clock signals (typically < 1.5 ns clock delay) to IOBs on the top and bottom of the die.

XLA/XV Power Requirements

XC4000XLA devices require 40% less power per CLB than equivalent XL devices. XC4000XV devices require 42% less power per CLB than equivalent XLA devices and 65% less power than XL devices The representative K-Factor for the following families can be found in Table 2. The K-Factor predicts device current for typical user designs and is based on filling the FPGA with active 16-Bit counters and measuring the device current at 1 MHz. This technique is described in XBRF14 "A Simple Method of Estimating Power in XC4000XL/EX/E FPGAs". To predict device power (P) using the K-Factor use the following formula:

P=V*K*N*F; where:

P= Device Power
V= Power supply voltage
K= the Device K-Factor
N = number of active registers
F = Frequency in MHz

Table 2: K-Factor and Relative Power.

FPGA Family	K-Factor	Power Relative To XL	Power Relative To XLA
XC4000XL	28	1.00	1.65
XC4000XLA	17	0.60	1.00
XC4000XV	13	0.35	0.58

XLA/XV Logic Performance

XC4000XLA/XV devices feature 30% faster device speed than XL devices, and consistent performance is achieved across all family members. Table 3 illustrates the performance of the XLA devices. For details regarding the implementation of these benchmarks refer to XBRF15 "Speed Metrics for High Performance FPGAs".

Table 3: XLA/XV Estimated Benchmark Performance

Register - Register Benchmarks	Size	Maximum Frequency
Adder	8-Bit	172 MHz
	16-Bit	144 MHz
	32-Bit	108 MHz
2 Cascaded Adders	16-Bit	94 MHz
4 Cascaded Adders	16-Bit	57 MHz
Cascaded 4LUTs	1 Level	314 MHz
	2 Level	193 MHz
	4 Level	108 MHz
	6 Level	75 MHz
Interconnect (Manhattan Distance)	1 CLBs	325 MHz
	4 CLBs	260 MHz
	16 CLBs	185 MHz
	64 CLBs	108 MHz
	128 CLBs	81 MHz
Dual Port RAM (Pipelined)	8-Bits by 16	172 MHz
	8-Bits by 256	172 MHz

6

Using Fast I/O CLKS

There are several issues associated with implementing fast I/O clocks by using multiple FastCLK and BUFGE clock buffers for I/O transfers and a BUFGLS clock buffer for internal logic.

Reduced Clock to Out Period - When transferring data from a BUFGLS clocked register to an IOB output register which is clocked with a fast I/O clock, the total amount of time available for the transfer is reduced.

Using Fast Capture Latch in IOB input - It is necessary to transfer data captured with the fast I/O clock edge to a delayed BUFGLS clock without error. The use of the Fast Capture Latch in the IOBs provides this functionality.

Driving multiple clock inputs - Since each FastCLK input can only reach one octant of IOBs it will usually be necessary to drive multiple FastCLK and BUFGE input pads with a copy of the system clock. Xilinx recommends that systems which use multiple FastCLK and BUFGE input buffers use a "Zero Delay" clock buffer such as the Cypress CY2308 to drive up to 8 input pins. These devices contain a Phase locked loop to eliminate clock delay, and specify less than 250ps output jitter.

PCB layout - The recommended layout is to place the PLL underneath the FPGA on the reverse side of the PCB. All 8 clock lines should be of equal length. This arrangement will allow all the clock line to be less than 2 cm in length which will generally eliminate the need for clock termination.

Advancing the FPGAs clock - An additional advantage to using a PLL-equipped clock buffer is that it can advance the FPGA clocks relative to the system clock by incorporating additional board delay in the feedback path. Approximately 6 inches of trace length are necessary to delay the signal by 1 ns.

Advancing the FPGA's clock directly reduces input hold requirements and improves clock to out delay. FPGA clocks should not be advanced more than the guaranteed minimum Output Hold Time (minus any associated clock jitter) or the outputs may change state before the system clock edge. For XLA and XV FPGAs the Output Hold Time is specified as a minimum Clock to Output Delay in the tables in the respective family Electrical Specification sections. The maximum recommended clock advance equals this value minus any clock jitter.

Instantiating I/O elements- Depending on the design environment, it may be necessary to instantiate the fast I/O elements. They are found in the libraries as:

- **BUFGE (I,O)** - The Global Early Buffer
- **BUFGLS (I,O)**- The Global Low Skew Buffer
- **BUFFCLK (I,O)** - The FastCLK Buffer
- **ILFFX (D, GF, CE, C, Q)** - The Fast Capture Latch Macro

Locating I/O elements - It is necessary to connect these elements to a particular I/O pad in order to select which buffer or fast capture latch will be used.

Restricted Clock Loading - Because the input hold requirement is a function of internal clock delay, it may be necessary to restrict the routing of BUFGE to IOBs along the top and bottom of the die to obtain sub-ns clock delays.

Figure 2: Location of FastCLK, BUFGE and BUFGLS Clock Buffers in XC4000XLA/XV FPGAs

Figure 3: Diagram of XC4000XLA/XV FPGA Connected to PLL Clock Buffer Driving 4 BUFGE and 4 FastCLK Clock Buffers.

JTAG Enhancements

XC4000XLA/XV devices have improved JTAG functionality and performance in the following areas:

- **IDCODE** - The IDCODE register in JTAG is now supported. All future Xilinx FPGAs will support the IDCODE register. By using the IDCODE, the device connected to the JTAG port can be determined. The use of the IDCODE enables selective configuration dependent upon the FPGA found. The IDCODE register has the following binary format:
  `vvvv:ffff:fffa:aaaa:aaaa:cccc:cccc:ccc1`
  Where:
  c = the company code;
  a = the array dimension in CLBs;
  f = the Family code;
  v = the die version number

  Family Codes = 01 for XLA;
  = 02 for SpartanXL;
  = 03 for Virtex;
  = 07 for XV.

  Xilinx company code = 49 (hex)

Table 4: IDCODEs assigned to XC4000XLA/XV FPGAs

FPGA	IDCODE
XC4013XLA	0x00218093
XC4020XLA	0x0021c093
XC4028XLA	0x00220093
XC4036XLA	0x00224093
XC4044XLA	0x00228093
XC4052XLA	0x0022c093
XC4062XLA	0x00230093
XC4085XLA	0x00238093
XC40110XV	0x00e40093
XC40150XV	0x00e48093
XC40200XV	0x00e54093
XC40250XV	0x00e5c093

- **Configuration State** - The configuration state is available to JTAG controllers.
- **Configure Disable** - The JTAG port can be prevented from reconfiguring the FPGA
- **TCK Startup** - TCK can now be used to clock the start-up block in addition to other user clocks.
- **CCLK holdoff** - Changed the requirement for Boundary Scan Configure or EXTEST to be issued prior to the release of INIT pin and CCLK cycling.
- **Reissue configure** - The Boundary Scan Configure can be reissued to recover from an unfinished attempt to configure the device.

- **Bypass FF -** Bypass FF and IOB is modified to provide DRCLOCK only during BYPASS for the bypass flip-flop and during EXTEST or SAMPLE/PRELOAD for the IOB register.

XV and XLA Family Differences

The high density of the XC4000XV family FPGAs is achieved by using advanced 0.25 micron silicon technology. A 2.5 Volt power supply (VCCINT) is necessary to provide the reduced supply voltage required by 0.25 micron internal logic, however to maintain TTL compatibility a 3.3V power supply (VCCIO) is required by the I/O.

To accommodate the higher gate capacity of XV devices, additional interconnect has been added. These differences are detailed below.

- **VCCINT (2.5 Volt) Power Supply Pins**
  The XV family of FPGAs requires a 2.5V power supply for internal logic, which is named VCCINT. The pins assigned to the VCCINT supply are named in the pinout guide for the XC4000XV FPGAs and in Table 5 on page 162.
- **VCCIO (3.3 Volt) Power Supply Pins**
  Both the XV and XLA FPGAs use a 3.3V power supply to power the I/O pins. The I/O supply is named VCCIO in the XV family.
- **Octal-Length Interconnect Channels**
  The XC40110XV, XC40150XV, XC40200XV, and XC40250XV have enhanced routing. Eight routing channels of octal length have been added to each CLB in both vertical and horizontal dimensions.

XLA-to-XL Socket Compatibility

The XC4000XLA devices are generally available in the same packages as equivalent XL devices, however the range of packages available for the XC4085XLA has been extended to include smaller packages such as the HQ240.

XV-to-XL/XLA Socket Compatibility

XC4000XV devices are available in five package options, pin-grid PG599 and ball-grid BG560, BG432, and BG352 and quad-flatpack HQ240. With the exception of the VCCINT power pins, XC4000XV FPGAs are compatible with XL and XLA devices in these packages if the following guidelines are followed:

- Lay out the PCB for the XV pinout.
- When an XL or XLA device is installed disconnect the VCCINT (2.5 V) supply. For the PG599, VCCINT should be connected to 3.3V. For BG560, BG432 and BG352 and HQ240 packages, the VCCINT voltage source should be left unconnected. The unused I/O pins in the XL/XLA devices connected to VCCINT will be pulled up to 3.3V. Care must be taken to insure that these pins are not driven when the XL/XLA device is operative.
- When an XC4000XV is installed, the VCCINT pins must

6

be connected to a 2.5V power supply.

The differences between the XL and XV packages are detailed below:

PG559 - XLA and XL devices in the PG599 package have 56 VCC pins.The XC4000XV devices allocate 16 of these I/O pins to VCCINT (2.5V).

BG560 - XLA and XL devices in the BG560 package have 448 I/O pins.The XC4000XV devices allocate 16 of these I/O pins to VCCINT (2.5V).

BG432- XLA and XL devices in the BG432 package have 352 I/O pins. The XC4000XV devices allocate 16 of these I/O pins to VCCINT (2.5V).

BG352 - XLA and XL devices in the BG352 package have 289 I/O pins.The XC4000XV devices allocate 15 of these I/O pins to VCCINT (2.5V).

HQ240- XLA and XL devices in the HQ240 package have 193 I/O pins.The XC4000XV devices allocate 15 of these I/O pins to VCCINT (2.5V).

Table 5: VCCINT (2.5 V) Pins in XV Packages

I/O Signalling Standards

XLA and XV devices are compatible with TTL, LVTTL, PCI 3V, PCI 5V and LVCMOS signalling. The various standards are illustrated in Table 6 and the signaling environment is illustrated in Figure 4.

VCC Clamping

XLA/XV devices are fully 5V TTL I/O compatible if VCC clamping is not enabled. The I/O pins can withstand input voltages up to 7V. With VCC clamping enabled, the XLA/XV devices will begin to clamp input voltages to one diode voltage drop above VCC. In both cases negative voltage is clamped to one diode voltage drop below ground.

XLA/XV devices maintain LVTTL I/O compatibility when VCC clamping is enabled, however full 5.0V TTL I/O compatibility is sacrificed.

Overshoot and Undershoot

Ringing wave forms are allowed on XLA/XV inputs as long as undershoot is limited to -2.0V and overshoot is limited to +7.0V and current is limited to 100 mA for less than 10 ns. If VCC clamping is enabled then overshoot will begin to be clamped at VCC/VCCIO plus one diode voltage drop and undershoot will be clamped to ground minus one diode voltage drop. In either case the current must be limited to 100 mA per pin for less than 10 ns.

Table 6: I/O Standards supported by XC4000XLA and XV FPGAs

Signaling Standard	VCC Clamping	Output Drive	V_{IH_MAX}	$V_{IH\ MIN}$	$V_{IL\ MAX}$	$V_{OH\ MIN}$	$V_{OL\ MAX}$
TTL	Not allowed	12/24 mA	5.5	2.0	0.8	2.4	0.4
LVTTL	OK	12/24 mA	3.6	2.0	0.8	2.4	0.4
PCI5V	Not allowed	24 mA	5.5	2.0	0.8	2.4	0.4
PCI3V	Required	12 mA	3.6	50% of VCC/VCCIO	30% of VCC/VCCIO	90% of VCC/VCCIO	10% of VCC/VCCIO
LVCMOS 3V	OK	12/24 mA	3.6	50% of VCC/VCCIO	30% of VCC/VCCIO	90% of VCC/VCCIO	10% of VCC/VCCIO
Figure 4: **The Signalling Environment for XLA/XV FPGAS.** For XLA devices the VCCIO and VCCINT supplies are replaced by a single 3.3 Volt VCC supply, however, all indicated I/O signalling is still supported.

Express Configuration Mode

Express configuration mode is similar to Slave Serial configuration mode, except that data is processed one byte per CCLK cycle instead of one bit per CCLK cycle. An external source is used to drive CCLK, while byte-wide data is

loaded directly into the configuration data shift registers (Figure 5). A CCLK frequency of 10 MHz is equivalent to a 80 MHz serial rate, because eight bits of configuration data are loaded per CCLK cycle. Express mode does not sup-

port CRC error checking, but does support constant-field error checking. A length count is not used in Express mode.

Express mode must be specified as an option to the BitGen program, which generates the bitstream. The Express mode bitstream is not compatible with the other configuration modes. Express mode is selected by a <010> on the mode pins (M2, M1, M0).

The first byte of parallel configuration data must be available at the D inputs of the FPGA a short setup time before the second rising CCLK edge. Subsequent data bytes are

clocked in on each consecutive rising CCLK edge (Figure 6).

Pseudo Daisy Chain

As illustrated in Figures 5 and 6, multiple devices with different configurations can be configured in a pseudo daisy chain provided that all of the devices are in Express mode. A single combined byte-wide data stream is used to configure the chain of Express mode devices. CCLK pins are tied together and D0-D7 pins are tied together as a data buss for all devices along the chain. A status signal is passed from DOUT of each device to the CS1 input of the device which follows it in the chain. Frame data is accepted only when CS1 is High and the device's configuration memory is not already full. The lead device in the chain has its CS1 input tied High (or floating, since there is an internal pullup). The status pin DOUT is initially High for all devices in the chain until the data stream header of seven bytes is loaded. This allows header data to be loaded into all devices in the chain simultaneously. After the header is loaded in all devices, their DOUT pins are pulled Low disabling configuration of all devices in the chain except the first device. As each device in the chain is filled, its DOUT goes High driving High the CS1 input of the next device, thereby enabling configuration of the next device in the pseudo daisy chain.

The requirement that all DONE pins in a daisy chain be wired together applies only to Express mode, and only if all devices in the chain are to become active simultaneously. All 4000XLA/XV devices in Express mode are synchronized to the DONE pin. User I/O for each device becomes active after the DONE pin for that device goes High (The exact timing is determined by BitGen options.)

Since the DONE pin is open-drain and does not drive a High value, tying the DONE pins of all devices together prevents all devices in the chain from going High until the last device in the chain has completed its configuration cycle. If the DONE pin of a device is left unconnected, the device

becomes active as soon as that device has been configured.

Table 7: Pin Functions During Configuration (4000XLA/XV Express mode only)

CONFIGURATION MODE <M2:M1:M0>	USER OPERATION
EXPRESS MODE <0:1:0>	PIN FUNCTION
M2(LOW) (I)	M2
M1(HIGH) (I)	M1
M0(LOW) (I)	M0
HDC (HIGH)	I/O
$\overline{\text{LDC}}$ (LOW)	I/O
$\overline{\text{INIT}}$	I/O
DONE	DONE
$\overline{\text{PROGRAM}}$ (I)	$\overline{\text{PROGRAM}}$
CCLK (I)	CCLK (I)
DATA 7 (I)	I/O
DATA 6 (I)	I/O
DATA 5 (I)	I/O
DATA 4 (I)	I/O
DATA 3 (I)	I/O
DATA 2 (I)	I/O
DATA 1 (I)	I/O
DATA 0 (I)	I/O
DOUT	SGCK4-I/O
TDI	TDI-I/O
TCK	TCK-I/O
TMS	TMS-I/O
TDO	TDO-(O)
CS1	I/O

Notes   1. A shaded table cell represents the internal pull-up used before and during configuration.
   2. (I) represents an input; (O) represents an output.
   3. $\overline{\text{INIT}}$ is an open-drain output during configuration.

Because only XC4000XLA/XV, SpartanXL, and XC5200 devices support Express mode, only these devices can be used to form an Express mode pseudo daisy chain.
99010800

Figure 5: Express Mode Circuit Diagram

Table 8: Express Mode Programming Switching Characteristic

	Description	Symbol	Min	Max	Units
CCLK	$\overline{INIT}$ (High) setup time	T_{IC}	5		µs
	D0 - D7 setup time	T_{DC}	20		ns
	D0 - D7 hold time	T_{CD}	0		ns
	CCLK High time	T_{CCH}	45		ns
	CCLK Low time	T_{CCL}	45		ns
	CCLK Frequency	F_{CC}		10	MHz
			Preliminary		

Byte A is first frame byte for first FPGA
Byte B is last frame byte for first FPGA
Byte C is first frame byte for second FPGA

99012600
Note: CS1 *must* remain High throughout loading of the configuration data stream. In the pseudo daisy chain of Figure 5, the 7 byte data stream header is loaded into all devices simultaneously. Each device's data frames are then loaded in turn when its CS1 pin is driven High by the DOUT of the preceding device in the chain.

Figure 6: Express Mode Configuration Switching Waveforms

Data Stream Format

The data stream ("bitstream") format is identical for all serial configuration modes, but different for the 4000XLA/XV Express mode. In Express mode, the device becomes active when DONE goes High, therefore no length count is required. Additionally, CRC error checking is not supported in Express mode. The data stream format is shown in Table 9. Express mode data is shown with D0 at the left and D7 at the right.

The configuration data stream begins with two bytes of eight ones each, a preamble code of one byte, followed by three bytes of eight ones each, and finally an end-of-header field check byte. This header of seven bytes is followed by the actual configuration data in frames. The length and number of frames depends on the device type. Each frame begins with a start field and ends with an end-of-frame field check byte. In all cases, additional start-up bytes of data are required to provide six, or more, clocks for the start-up sequence at the end of configuration. Long daisy chains require additional startup bytes to shift the last data through the chain. All startup bytes are don't-cares; these bytes are not included in bitstreams created by the Xilinx software.

A selection of CRC or non-CRC error checking is allowed by the bitstream generation software. The 4000XLA Express mode only supports non-CRC error checking. The non-CRC error checking tests for a designated end-of-frame field check byte for each frame. non-CRC error checking tests for a designated end-of-frame field check byte for each frame.

Table 9: 4000XLA/XV Express Mode Data Stream Format

Data Type	Express Mode (D0-D7) (4000XLA only)
Fill Byte	FFFFh
Preamble Code	11110010b
Fill Byte	FFFFFFh
End-of-Header Field Check Byte	11010010b
Start Field	11111110b
Data Frame	DATA(n-1:0)
End-of-Frame Field Check Byte	11010010b
Extend Write Cycle	FFD2FFFFFFh
Start-Up Bytes	FFFFFFFFFFFFh

LEGEND:

Unshaded	Once per data stream
Light	Once per data frame

Detection of an error results in the suspension of data loading and the pulling down of the INIT pin. The user must detect INIT and initialize a new configuration by pulsing the PROGRAM pin Low or cycling VCC.

Serial PROM Recommendation

Table 10 shows the physical characteristics of each XLA/XV family member and the recommended Xilinx Serial PROM recommended for use as configuration storage.

Table 10: Physical Characteristics and Recommended Serial PROM

Device	Max. User I/O	CLB Matrix	Total CLBs	Logic Cells	Number of Flip-Flops	Max. RAM Bits (No Logic)	Required Configuration Bits	Serial PROM

XC4000 Series Electrical Characteristics and Device-Specific Pinout Tables

For the latest Electrical Characteristics and pinout information for each XC4000 Family, see the Xilinx web site at

http://www.xilinx.com/partinfo/databook.htm#xc4000

Revision Control

Version	Description
2/1/99 (1.0)	Release included in 1999 data book, section 6
2/19/99 (1.1)	Updated Switching Characteristics Tables
5/14/99 (1.2)	Replaced Electrical Specification pages for XLA and XV families with separate updates and added URL link on placeholder page for electrical specifications/pinouts for WebLINX users.
10/18/99 (1.3)	Deleted HQ304 package/XC4028XLA and XC4036XLA entries from Table 11, page 6-168. Changed do DS015.
