

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceed the OCM data sheet.

 - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OEM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

Features

- Optimized for 1.8V systems
 - As fast as 4.0 ns pin-to-pin logic delays
 - As low as 15 μ A quiescent current
- Industry's best 0.18 micron CMOS CPLD
 - Optimized architecture for effective logic synthesis
 - Multi-voltage I/O operation — 1.5V to 3.3V
- Available in multiple package options
 - 44-pin PLCC with 33 user I/O
 - 44-pin VQFP with 33 user I/O
 - 48-land QFN with 37 user I/O
 - 56-ball CP BGA with 45 user I/O
 - 100-pin VQFP with 64 user I/O
 - Pb-free available for all packages
- Advanced system features
 - Fastest in system programming
 - 1.8V ISP using IEEE 1532 (JTAG) interface
 - IEEE1149.1 JTAG Boundary Scan Test
 - Optional Schmitt-trigger input (per pin)
 - I/O Banking
 - RealDigital™ 100% CMOS product term generation
 - Flexible clocking modes
 - Optional DualEDGE triggered registers
 - Global signal options with macrocell control
 - Multiple global clocks with phase selection per macrocell
 - Multiple global output enables
 - Global set/reset
 - Efficient control term clocks, output enables and set/resets for each macrocell and shared across function blocks
 - Advanced design security
 - Optional bus-hold, 3-state or weak pullup on selected I/O pins
 - Open-drain output option for Wired-OR and LED drive
 - Optional configurable grounds on unused I/Os
 - Mixed I/O voltages compatible with 1.5V, 1.8V, 2.5V, and 3.3V logic levels
 - PLA architecture
 - Superior pinout retention
 - 100% product term routability across function block
 - Hot pluggable

Description

The CoolRunner-II 64-macrocell device is designed for both high performance and low power applications. This lends power savings to high-end communication equipment and high speed to battery operated devices. Due to the low power stand-by and dynamic operation, overall system reliability is improved.

This device consists of four Function Blocks inter-connected by a low power Advanced Interconnect Matrix (AIM). The AIM feeds 40 true and complement inputs to each Function Block. The Function Blocks consist of a 40 by 56 P-term PLA and 16 macrocells which contain numerous configuration bits that allow for combinational or registered modes of operation.

Additionally, these registers can be globally reset or preset and configured as a D or T flip-flop or as a D latch. There are also multiple clock signals, both global and local product term types, configured on a per macrocell basis. Output pin configurations include slew rate limit, bus hold, pull-up, open drain and programmable grounds. A Schmitt trigger input is available on a per input pin basis. In addition to storing macrocell output states, the macrocell registers may be configured as "direct input" registers to store signals directly from input pins.

Clocking is available on a global or Function Block basis. Three global clocks are available for all Function Blocks as a synchronous clock source. Macrocell registers can be individually configured to power up to the zero or one state. A global set/reset control line is also available to asynchronously set or reset selected registers during operation. Additional local clock, synchronous clock-enable, asynchronous set/reset and output enable signals can be formed using product terms on a per-macrocell or per-Function Block basis.

A DualEDGE flip-flop feature is also available on a per macrocell basis. This feature allows high performance synchronous operation based on lower frequency clocking to help reduce the total power consumption of the device.

The CoolRunner-II 64-macrocell CPLD is I/O compatible with standard LVTTTL and LVCMOS18, LVCMOS25, and LVCMOS33 (see [Table 1](#)). This device is also 1.5V I/O compatible with the use of Schmitt-trigger inputs.

RealDigital Design Technology

Xilinx CoolRunner-II CPLDs are fabricated on a 0.18 micron process technology which is derived from leading edge FPGA product development. CoolRunner-II CPLDs employ RealDigital, a design technique that makes use of CMOS technology in both the fabrication and design methodology. RealDigital design technology employs a cascade of CMOS gates to implement sum of products instead of traditional sense amplifier methodology. Due to this technology, Xilinx CoolRunner-II CPLDs achieve both high performance and low power operation.

Supported I/O Standards

The CoolRunner-II 64 macrocell features both LVCMOS and LVTTTL I/O implementations. See [Table 1](#) for I/O standard voltages. The LVTTTL I/O standard is a general purpose EIA/JEDEC standard for 3.3V applications that use an LVTTTL input buffer and Push-Pull output buffer. The

LVCMOS standard is used in 3.3V, 2.5V, 1.8V applications. CoolRunner-II CPLDs are also 1.5V I/O compatible with the use of Schmitt-trigger inputs.

Absolute Maximum Ratings

Symbol	Description	Value	Units
V_{CC}	Supply voltage relative to ground	-0.5 to 2.0	V
V_{CCIO}	Supply voltage for output drivers	-0.5 to 4.0	V
$V_{JTAG}^{(2)}$	JTAG input voltage limits	-0.5 to 4.0	V
V_{AUX}	JTAG input supply voltage	-0.5 to 4.0	V
$V_{IN}^{(1)}$	Input voltage relative to ground ⁽¹⁾	-0.5 to 4.0	V
$V_{TS}^{(1)}$	Voltage applied to 3-state output ⁽¹⁾	-0.5 to 4.0	V
$V_{STG}^{(3)}$	Storage Temperature (ambient)	-65 to +150	°C
T_J	Junction Temperature	+150	°C

Notes:

- Maximum DC undershoot below GND must be limited to either 0.5V or 10 mA, whichever is easiest to achieve. During transitions, the device pins may undershoot to -2.0V or overshoot to +4.5V, provided this over or undershoot lasts less than 10 ns and with the forcing current being limited to 200 mA.
- Valid over commercial temperature range.
- For soldering guidelines and thermal considerations, see the [Device Packaging](#) information on the Xilinx website. For Pb free packages, see [XAPP427](#).

Device Part Marking

Figure 5: Sample Package with Part Marking

Note: Due to the small size of chip scale and quad flat no lead packages, the complete ordering part number cannot be included on the package marking. Part marking on chip scale and quad flat no lead packages by line are:

1. X (Xilinx logo) then truncated part number
2. Not related to device part number
3. Not related to device part number
4. Device code, speed, operating temperature, three digits not related to device part number. Device codes: C3 = CP56, C4 = CPG56, Q2 = QFG48.
